

Cyber liability insurance coverage for the health care industry

A.M. Best rating of A+ (Superior), FSC XV

Maximize your security. Minimize the damages.

In the health care environment, data is generated by multiple channels and not always verified. In addition, the health care segment has seen the migration of paper-based records to digitized medical or health records, which is more easily transferred between members of the health care network. Due to the sensitivity of personal health and financial information collected by health care networks, the health care industry has seen an increase in its exposure as PHI (private health insurance) becomes highly coveted on the dark web. The complexity of exposure faced by the health care segment has created a need for collaboration with partners that can help mitigate these cyber threats. Let us help. Nationwide's enterprise cyber insurance coverage for the health care industry is a service-based solution designed to enhance your organization's cyber risk profile. Not only do you have a creative solution that fits your needs, but policyholders have access to loss prevention services, breach response and remediation expertise, and an experienced claim team.

Cyber exposure for the health care industry:

- Extensive amount of personally identifiable information and protected health information transmitted and stored on system
- Increasing dependency on third-party vendors, such as labs and payment processors
- Large amounts of sensitive data being transferred between health care networks
- Human error when processing highly sensitive information
- Increasing attacks against the health care industry

Who we insure:

- Hospitals
- Health care networks
- Laboratories
- Health care exchanges
- Health insurance companies
